

## *Sleep Tips from LIQUID MIND®*

We all lead different lives, have varying levels of stress, health and metabolism, but one thing we all have in common is the need for a healthy night's sleep. If you consistently have a problem sleeping, or staying asleep, these suggestions may help, however, it is best to contact a healing professional to rule out a causal underlying medical condition.

The following is a collection of some common sense (and some scientifically proven) tips for setting ourselves up for success in getting a good night's sleep. Many of them have been useful to me over the years, feel free to take what you like and leave the rest:

- Many studies show a health benefit and higher quality of sleep from having routine sleep/wake times. Try going to bed and waking up at the same time(s) each day.
- Lower the lights in your sleeping and living areas at least thirty minutes before bedtime to help set the stage for a good night's sleep.
- Try to sleep in complete darkness, and keep your bathroom night-light to a safe minimum brightness. Any light during the night tells your brain it's time to wake up, leading to confused body rhythms. Black-out window shades are widely available.
- Research studies have shown that listening to relaxing music 45 minutes before bed improves quality of sleep in older adults.
- Most sleep authorities suggest avoiding late night eating.
- Avoid stimulating activities like television or work just before going to bed, as they can disrupt time-to-sleep and quality of sleep. Instead, a few minutes of a simple clearing meditation (like slowly counting to 10, counting 1,2,3 etc. for each breath in and out) can set the stage for a peaceful night's sleep.
- If possible, keep your bedroom and bathroom free of reminders of work.
- If you enjoy reading before bed, choose your subject matter carefully, not to stimulate, but rather to relax.
- Minimize nitecaps: Though alcohol has a short term drowsiness effect, it may reduce sleep quality as the alcohol wears off, interrupting the healing and regenerating stages of sleep.
- Try to avoid drinking lots of liquids just before bed (unless you are dehydrated) to minimize the likelihood of awakening during the night.
- Say a calming affirmation just as you lay down each night, for example: "I let go of all the day's activities and now enter a relaxing, regenerating and healing sleep."

Happy sleeping!
